

PARTNER

CAPABILITY PROFILE

**Practical solutions.
Executable plans.
Reliable delivery.**

Integrated project services & delivery

Practical alternatives • Executable plans • Site delivery

Synchronize Assets • Homogenize Operations

The partner behind an executable scope

ABOUT US

SyncHomo Solutions Company supports OEMs, EPC contractors and specialist providers on greenfield and brownfield projects. We develop practical technical alternatives, define executable scopes and coordinate the resources needed to deliver them. Across electrical, mechanical and automation disciplines, our services span tendering, procurement, project management, construction, installation, testing, commissioning, maintenance and critical response.

Develop the solution

Compare practical alternatives and resolve technical and site requirements.

Plan for execution

Convert scope into materials, methods, schedule, resources and interfaces.

Deliver the work

Manage and execute the package through testing, commissioning and handover.

Solutions that can be built

We look beyond a standard product or construction method to develop a workable technical route and the plan to execute it. These services strengthen both new-build and existing-facility projects.

Technical alternatives

Develop customized equipment, material, method and phasing options for a difficult requirement.

Execution planning

Turn a concept into a buildable sequence with resources, access, interfaces and commissioning steps.

Interface resolution

Resolve gaps between packages, disciplines, systems and actual field conditions.

Value and schedule optimization

Reduce rework and critical delays through practical alternatives and staged work.

Critical issue recovery

Find a workable route when a technical issue, material or site condition threatens delivery.

Project management support

Plan and control scope, schedule, cost, procurement, risk, quality, reporting and handover.

A useful partner at every stage

SyncHomo can join at the idea, tender, procurement, construction, commissioning or support stage. We contribute a defined service, a subcontract package or an integrated delivery role.

For OEMs

Translate product capability into a workable project package; support site integration, local installation, testing, commissioning and aftermarket response.

For EPCs

Strengthen bids and execution with scope breakdown, BOQ inputs, project controls, interface planning, subcontract works and commissioning.

For service providers

Combine specialist services and materials with cross-discipline coordination, project management and field execution.

WAYS TO ENGAGE

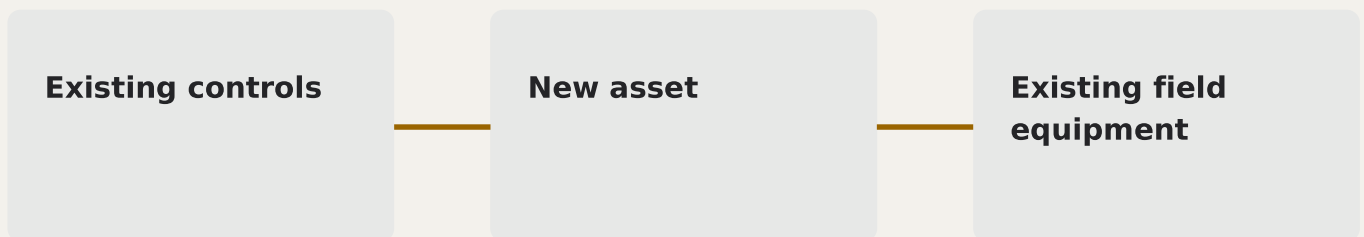

Defined services	Technical solutions, bid input, RFQ package, project management or commissioning support.
Subcontract package	Supply, construction, installation, testing or commissioning works.
Opportunity partnership	Combined resources and delivery responsibilities for a specific bid or project.

From a single work package to a coordinated project scope, SyncHomo connects the plan with execution.

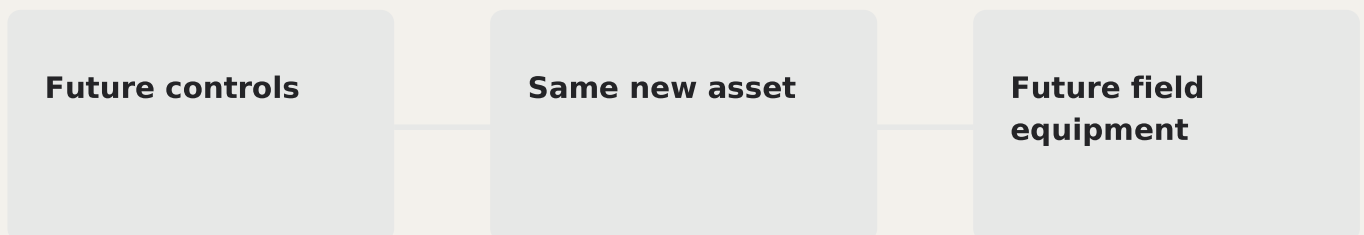

New equipment must work on day one

A replacement is successful only when it works with the systems that remain in service and with the next approved stages of renewal. We map both states before the first site intervention.

AT FIRST INSTALLATION

THROUGH FUTURE RENEWAL

ONE INTERFACE AND MIGRATION PLAN

We review ratings and duty, protection, cabling, terminations, motor starting, controls, communications, alarms, space, access and outage windows. The agreed scope records what the partner supplies, what SyncHomo executes and how the complete system will be verified and handed over.

From the idea to site handover

We support the technical and management work that connects an opportunity to delivery. One coordinated plan aligns the scope, resources, procurement, schedule and site execution.

01

Develop the solution

Review the requirement, technical options, interfaces and site constraints.

02

Prepare the bid

Define scope, BOQ inputs, materials, method, schedule and commercial assumptions.

03

Plan execution

Organize resources, procurement, access, permits and work sequence.

04

Manage the project

Control scope, schedule, cost, risk, quality, reporting and stakeholders.

05

Execute the works

Coordinate supply, construction, installation and system integration.

06

Verify and hand over

Inspect, test, commission, close defects and transfer records.

Project management support can be provided as a dedicated service or alongside a delivery package.

Electrical / Mechanical / Automation

Electrical

Power distribution, switchgear, transformers, protection, MCCs, cables and grounding. Construction, installation, testing and commissioning.

Mechanical

Rotating equipment, compressors, HVAC and piping. Repair, replacement, critical spares, construction and commissioning.

Automation

Controls, instrumentation, monitoring and communications. New systems, upgrades, integration and functional testing.

Packages may be discipline-specific or integrated, with the interface responsibilities stated in the agreed scope.

Support when the site cannot wait

Partners may need rapid access to site facts, compatible parts, specialist resources or temporary operating options. SyncHomo can help structure the response and deliver an approved field scope.

Installed-base facts

Identify the equipment, connected systems, failures, constraints and available records.

Materials and providers

Facilitate compatible components, alternative sources and specialist engagement.

Temporary continuity

Support rental or bypass planning, interfaces, operating limits and verification.

Site rectification

Undertake or coordinate agreed repair, replacement, testing and restoration.
